

# **T513: SAE Aero Design Competition** N. Aguirre, L. Evans, D. Litter, H. Lopez, M. Kvitkovičová, Z. Silver

#### Objective

**X** Use additive manufacturing to produce a radio-controlled airplane capable of competing in the SAE Aero Design East Competition

## **Competition Requirements**

#### Mission Requirements: 4 Downwind Base turr 3 Crosswind 6 Final approac Climb Travel 400 feet before turn and within 400 feet 🚄 Takeoff within 100 feet 2 minutes to unload

Airplane Requirements:

- $\bowtie$  Maximum wingspan of 120 inches
- Maximum gross-take-off weight of 55 lbs
- ✓ Carry an unmodified size 5 soccer ball
- $\succ$  Limited to 1000 W of Power
- Minimum 6S 22.2V Lithium polymer battery
- ✗ No lead of fiber-reinforced materials

## **Electronics Setup**

**\*** The final wiring diagram for the plane, showing the acquired parts and components to complete the circuit

## **Airfoil Selection**

✗ Considered four airfoils: (2) heavy lift UAV style and (2) STOL style ➤ Desired high lift and stable airfoil style  $\checkmark$  Selected Eppler E423 airfoil with  $C_{l,max} = 2.00$ 

**K** Estimated performance parameters: ✗ Takeoff distance of 49.6 ft at 23.4 mph  $\varkappa$  Wing loading of 34.3 oz/in<sup>2</sup> and aspect ratio of 5.1

✓ Prepare SAE competition documents ★ Attend SAE competition

#### Airplane Design

**\*** The final selected concept is a semi-tapered rectangular wing located high on a flying boat fuselage with boom tail and conventional horizontal and vertical stabilizer

✗ Tail dragger style landing gear. 3D printed with light-weight PLA

Gross Takeoff Weight = 15 lb.

#### **Future Work**

✗ Rapid prototype for unloading payload design

✓ Create CAD model of all airplane components

**\*** Satisfy stability and control requirements

**×** Compare theoretical to actual center of gravity

**×** Conduct 3D printing infill tests to find appropriate strength-tolightweight compromise

Manufacture flight worthy prototype

✗ Prototype test flight
